

FUTMON
forest monitoring for the future

Vegetation response to critical limits exceedances

Peter Waldner, Anne Thimonier, Elisabeth Graf Pannatier, Aldo Marchetto, Marco Ferretti, Pasi Rautio, Kirsti Derome, Tiina Nieminen, Susanne Iost, Oliver Granke, Antti-Jussi Lindroos, Päivi Merilä, Bruno de Vos, Karin Hansen, Hans-Peter Dietrich, Richard Fischer, Hans-Dieter Nagel, Thomas Scheurer, Thomas Scheuschner, Matthias Dobbertin, Hans-Peter Dietrich, Primoz Simoncic and others

a Life+ co-financed project for the "Further Development and Implementation of an EU-level Forest Monitoring System".

The project coordination centre is situated at the Institute for World Forestry, Hamburg, Germany.

FUTMON
forest monitoring for the future

Hypothesis

Human made emissions

SO_x , NO_x , NH_3 , ...

Eutrophication

(Aber et al. 1989 and others)

(+) Growth increase in N limited forests

(-) Imbalanced foliar nutrition

(-) Nitrate Leaching (Le) into ground water

(-) Vulnerability against frost, defoliators and disease may increase

FUTMON
forest monitoring for the future

Critical Loads

Human made emissions

SO_x , NO_x , NH_3 , ...

Eutrophication

(Aber et al. 1989 and others)

(+) Growth increase in N limited forests

(-) Imbalanced foliar nutri

(-) Nitrate Leaching (Le) in

(-) Vulnerability against fro
and disease may increa

deposition

**UN-ECE Convention on Long-Range
Transboundary Air Pollution (Geneva 1979)**

Critical Loads, Levels and Limits:

"A quantitative estimate of an exposure to one or more pollutants below which significant harmful effects on specified sensitive elements of the environment do not occur according to present knowledge."

(Skokloster Workshop, Nilsson & Grenfeld
1988)

, NH_4^+ , etc.
 Ca^{++} Mg^{++} K^{++} Al^{+++}

FUTMON
forest monitoring for the future

Critical Loads

Human made emissions

$\text{SO}_x, \text{NO}_x, \text{NH}_3, \dots$

Eutrophication

(Aber et al. 1989 and others)

(+) Growth increase in N limited forests
(cf. presentation M. Dobbertin)

(-) Imbalanced foliar nutrition

CL N Deposition: 10-20 kg N ha⁻¹a⁻¹ (Empiric)

(e.g. Achermann 2003)

Nitrate in soil solution $\text{NO}_3^- < c_{\text{crit}}$ (limits)

(cf. presentation P. Rautio)

(-) Nitrate Leaching (Le) into ground water

Leaching $< \text{Le}_{\text{acceptable}}$ (SMB)

(cf. presentation H.-D. Nagel)

(-) Vulnerability against frost, defoliators
and disease may increase

FUTMON
forest monitoring for the future

Outlook

Ecological Effects Study 2011 (-2012)

Outlook for 2011:

.. explore CL exceedance > further tree response:

- Visible symptoms of nutrient deficiencies
- Crown Condition

.. consider further ,confounding factors‘:

- Soil contents
- Stand age

... using:

- cooperation with national experts
- Quality Assurance informations
- Multivariate statistical approaches
- Spatial variation and Temporal changes

FUTMON
forest monitoring for the future

Preliminary Conclusions

Ecological Effects Study 2011 (-2012)

Conclusions

- Parts of plots with CL exceedance seem to be N saturated (high Nitrate below rooting zones) and effects are expected to already take place there.
- High N deposition tend to be related to
 - ... higher foliar N nutrition,
(N nutrition is partly still below optimal values, partly exceeds them)
 - .. and to lower Mg and K nutrients (partly below optimum)
- Similar relations between soil solution and foliar nutrition
- These first results are not in contradiction to the hypothesis of Acidification and Eutrophication.
- ICP-Forests data is suited to cross-check modelling and mapping with real data.
- The Long-term data series will enable to establish cause-effect relationships not only on spatial variability but also on temporal changes.
